Access Server and IP-Telephony-Gateway

Mainz, Nov.25, 1997 – The new Access Server Portline is a complete POP-in-a-Box for Remote Access. In addition, Portline can be used for connecting telephone network and Internet to place voice calls from telephone to telephone via Internet and from PC across the LAN to any telephone in the world. For voice over IP Portline supports the standardized H.323 protocol.

In contrast to proprietary solutions, Portline is based on standard PC components and offers outstanding scalability. The ISDN connection to the telephone network is made by E1/T1 boards for up to 120 users per device.

The equipment, developed by PAM Software in Mainz/Germany, may be managed remotely by WWW which makes Portline very ease to use.
